

ALPHALIST DEVELOPER BOOTCAMP / HAMBURG / JUNE 16-17, 2026

Pod blocks at a glance

What each hands-on block builds, and the timing per exercise.

DAY 1 / 11:30 / POD BLOCK 1

Day 1 morning: foundations

A menu, not a checklist. Everyone starts together at 11:30 with a 10 minute kickoff on the mechanism ladder, then splits by experience. Nobody is expected to finish everything.

TRACK A / STARTER TO INTERMEDIATE

11:40	00 Pirate CLAUDE.md	15 min
11:55	01 Pirate Skill	25 min
12:20	04 Planning Skill	35 min

TRACK B / ADVANCED

11:40	02 Rules	20 min
12:00	03 Subagent	30 min
12:30	04 Planning Skill, made stricter	30 min
Hook guardrail, if you finish early		OPTIONAL

Convergence point: a planning Skill that writes a Bean with a High-Level Plan. The afternoon needs that artifact, however you produce it.

DAY 1 / 14:30 / POD BLOCK 2

Day 1 afternoon: the pipeline

One common factory spine: planner, refine, implement. Start from the supplied baseline and swap in your own work as it is ready.

FLOW / THE BLOCK

14:30	Explain the factory contract	15 min
14:45	Build: pick one level (right)	50 min
15:35	Implement demo: trainer runs /implement	15 min
15:50	Debrief: what glued the factory together	10 min

BUILD / PICK ONE LEVEL

L1	Run the supplied planner and refine, inspect the Bean
L2	Replace the planner with your morning Skill
L3	Harden refine: a read-only subagent and stricter checks

The contract is the glue: planner writes the High-Level Plan, refine adds the Refined Plan, implement reads it. Rename a heading and the next station breaks.

DAY 2 / 10:00 / POD BLOCK 3

Day 2 morning: instrument your factory

Three moves on the Day 1 calculator factory: see a run, test it, make the fix stick. Do them in order.

TIMELINE / 10:00 TO 12:00

10:00	Setup and framing	10 min
10:10	01 See it	30 min
10:40	02 Test it	35 min
11:15	03 Make it stick	35 min
11:50	Reveal and show and tell prep	10 min

THE THREE MOVES

01	See it. Observability: make one run inspectable
02	Test it. Evals: validated on a good and a broken bean
03	Make it stick. Learning loops: turn a failure into a guard

You cannot eval what you cannot see, and you cannot close a loop you cannot eval. The order is the lesson.
